

Research Ethics and Scientific Integrity

- Group Presentation
- Course: Research Methods
- Prepared by: Group 9
- Date: January 2026

Introduction

- This research focuses on ethics in academic and scientific research.
- Ethics ensures honesty, safety, and respect for participants.
- Without ethics, research becomes unreliable and dangerous.

Background of the Study

- Many past researches caused human suffering.
- Examples: Nazi Experiments, Tuskegee Study, Pfizer Trial.
- These failures led to ethical rules in research.

Statement of the Problem

- Utilitarian Trap: Sacrificing individuals for 'greater good'.
- Integrity Gap: Data manipulation and plagiarism.
- Global Inequality: Exploitation of poor countries.

Aim and Objectives

- Aim: To prove ethics is the foundation of real science.
- Study ethical rules and failures.
- Analyze data manipulation.
- Provide solutions for improvement.

Research Methodology

- Qualitative Meta-Analysis.
- Review of ethical codes.
- Analysis of case studies.
- Study of retracted papers.

Key Findings

- Increase in research misconduct.
- Exploitation of vulnerable people.
- High level of data manipulation.
- Poor understanding of consent forms.
- Many studies cannot be repeated.

Discussion

- Ethical failure leads to fake science.
- AI threatens data privacy.
- Billions wasted on misconduct.
- One bad study can harm many lives.

Conclusion

- Ethics and quality are inseparable.
- Research without ethics is invalid.
- Researchers are moral agents.
- Honesty is essential.

Recommendations

- Regular ethics audits.
- Reduce pressure to publish.
- Improve global regulations.
- Strengthen AI data protection.
- Better ethics training.

Thank You

- Thank you for listening.
- Questions and Contributions.
